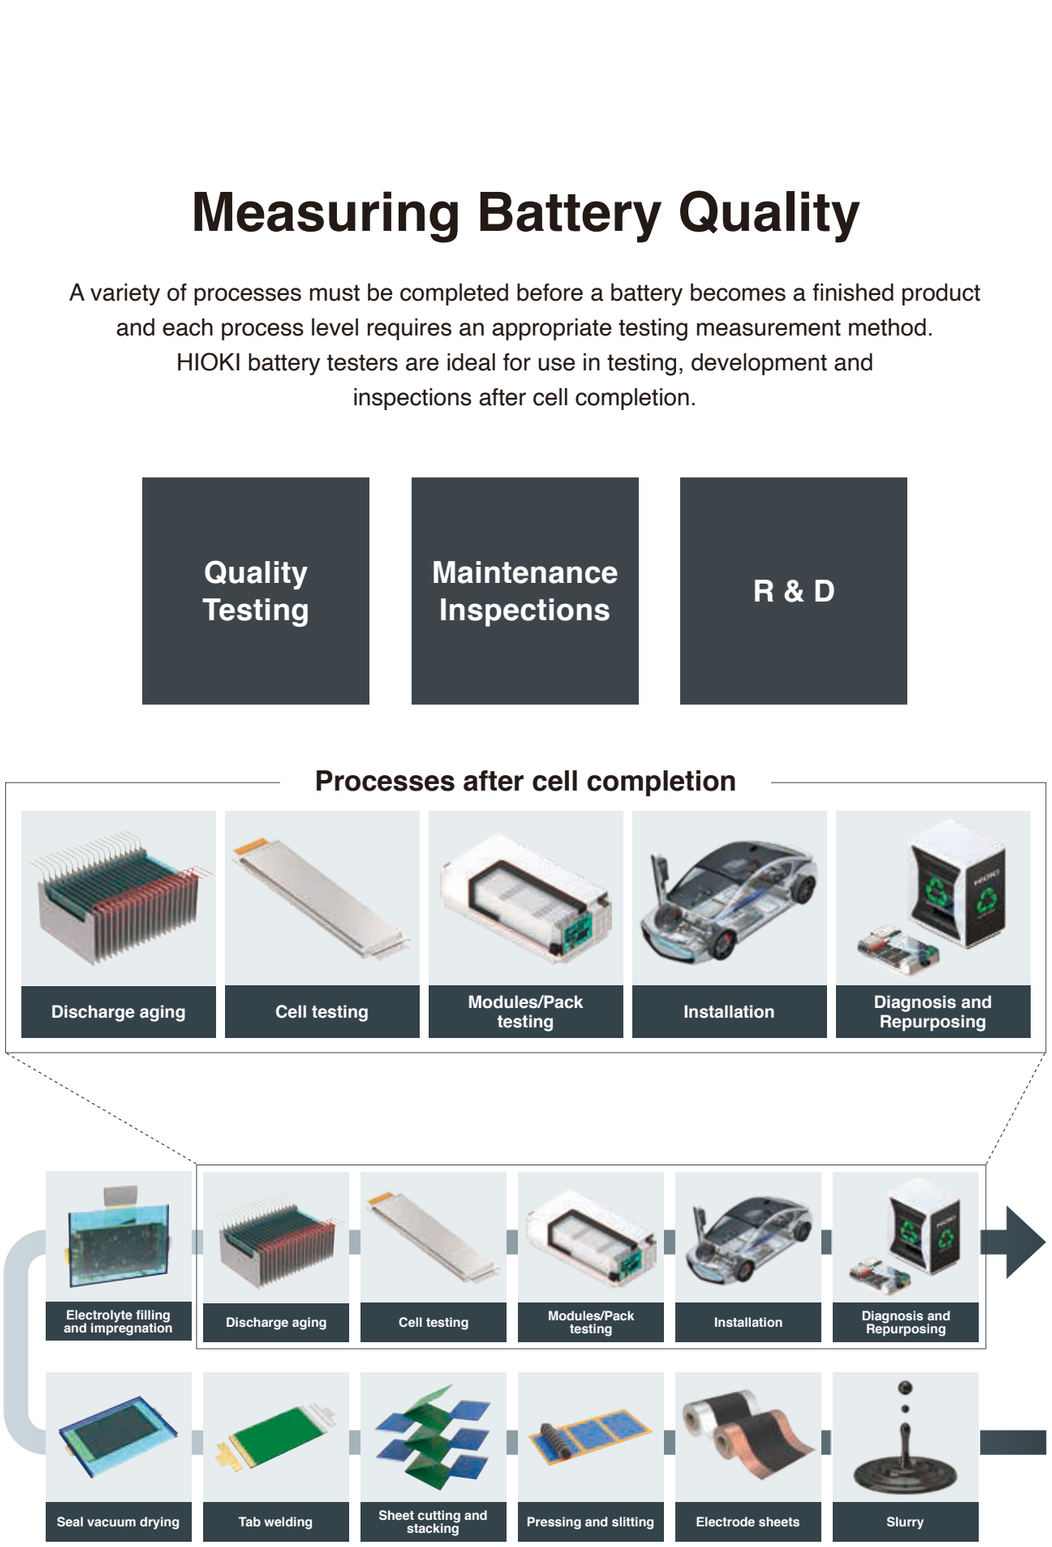
*1: BT3562-01, BT3563-01 only *2: BT3554-50, BT3554-51, BT3554-52 only

Measuring Battery Quality

A variety of processes must be completed before a battery becomes a finished product and each process level requires an appropriate testing measurement method. HIOKI battery testers are ideal for use in testing, development and inspections after cell completion.

Quality Testing | **Maintenance Inspections** | **R & D**

Processes after cell completion



Lithium-ion Battery Production Processes

Quality Testing
P.6 to P.16

Acceptance/shipping inspections

Inspect the quality of completed cells, modules, and packs on production lines.
Measure internal resistance (AC-IR) and open-circuit voltage (OCV) to check battery quality.

3561,3561-01

BT3561A

BT3562A

BT3563A

BT3562-01

BT3563-01

BT3564

BT4560

Measuring open-circuit voltage with a high degree of precision
Learn more P.9

High-precision OCV measurement makes it possible to detect defects earlier in the production process.

DC VOLTMETER DM7276

Increasing the number of test channels
Learn more P.14, P.15

Increase the number of test channels and automatically switch between them while measuring.

SWITCH MAINFRAME SW1002

Maintenance Inspections
P.17

Diagnosing degradation in batteries

Diagnose whether batteries embedded in a UPS or other system have degraded.

BT3554-50 (Instrument only)

BT3554-51 (9465-10 bundle)

BT3554-52 (L2020 bundle)

WIRELESS ADAPTER Z3210

R & D
P.18 - P.21

Analyzing batteries

Analyze the battery characteristics by frequency sweep impedance measurement and equivalent circuit analysis.

BT4560

Analyzing fuel cells (FCs)

Measure the internal resistance (1 kHz) of fuel cells during cycle testing.

BT3564-FC (Special specifications)

Measuring impedance over a broader frequency band
Learn more P.19

Broaden the measurement frequency range.

CHEMICAL IMPEDANCE ANALYZER IM3590

Performing dynamic impedance measurement
Learn more P.20, P.21

Measure the impedance of fuel cells or LIBs during cycle testing.

POWER ANALYZER PW6001

Battery tester lineup

Application			Acceptance/shipping inspections			
			Small cells for general purpose High speed sorting	Small cells for power motors Small packs of up to 60 V	Large cells for xEVs Mid-sized packs of up to 100 V	Large packs for xEVs Large packs of up to 300 V

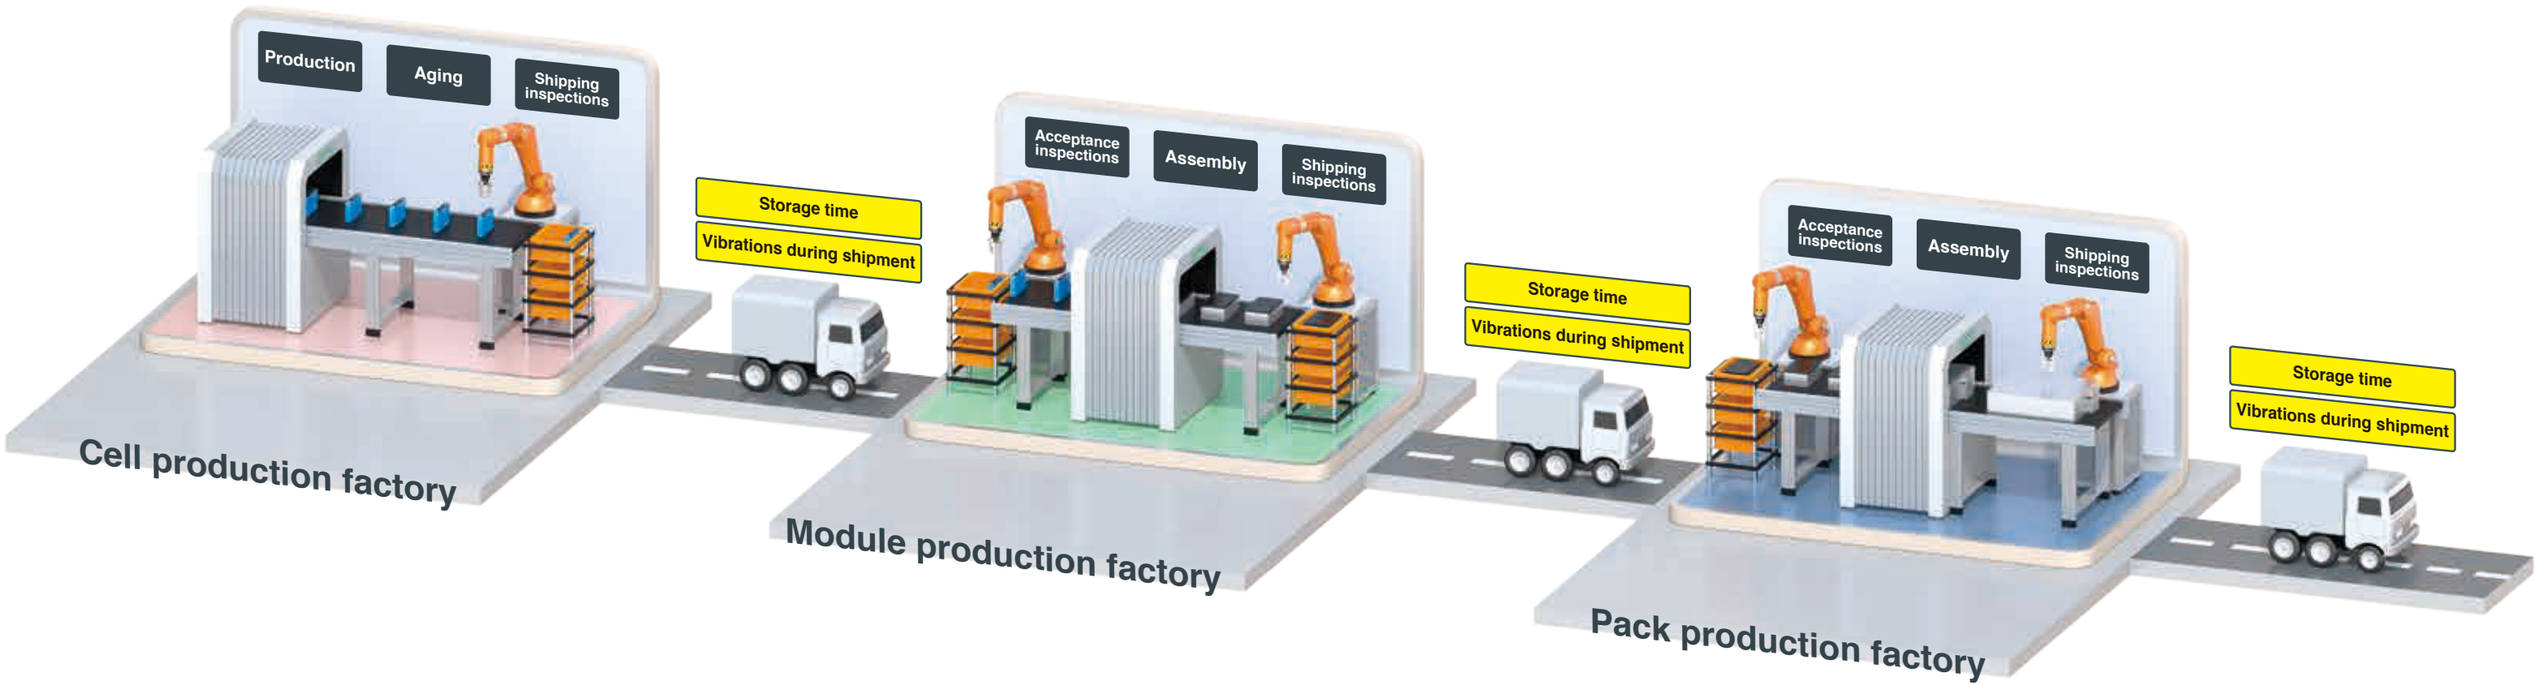
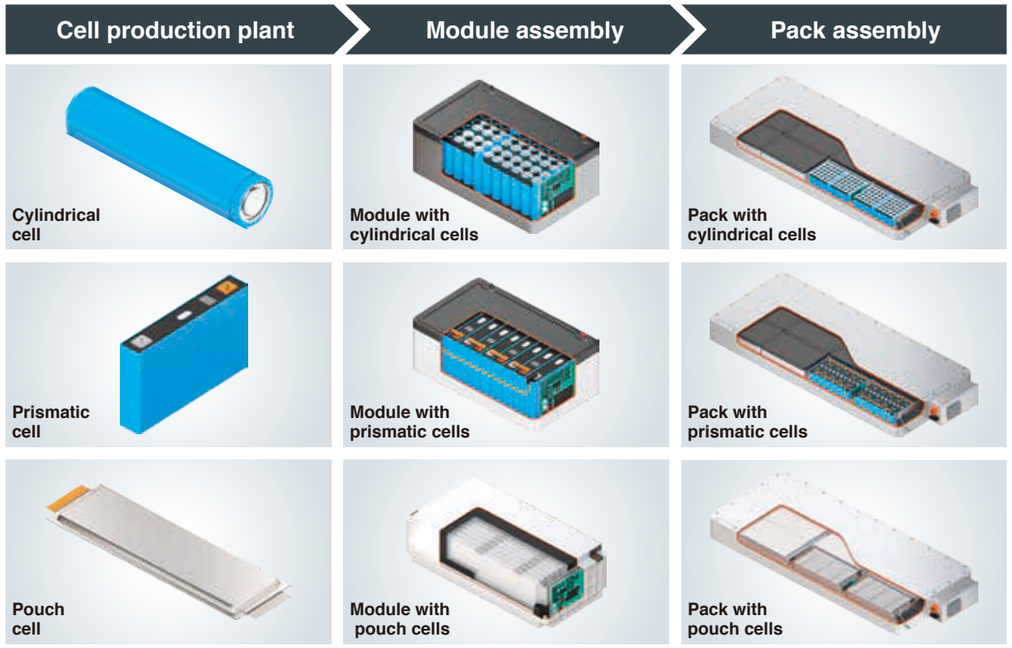
Measuring battery performance and safety





Measuring battery performance and safety using internal resistance (AC-IR) and open-circuit voltage (OCV)

Testing plays an important role in production processes by allowing plants to manufacture safe, high-performance batteries. During shipping and acceptance inspections, technicians assess battery performance by measuring internal resistance and safety by measuring open-circuit voltage.

Our Battery testers meet these needs...

“We want to manufacture batteries with stable performance.”

“We want to manufacture highly safe batteries.”

Assembly process (from cell batteries to pack batteries)

Cells produced at the cell production factory are shipped to the module production factory after undergoing a shipping inspection. Since factors such as vibrations during shipment and even the passage of time can cause defects, batteries undergo an acceptance inspection before being assembled into modules and packs.

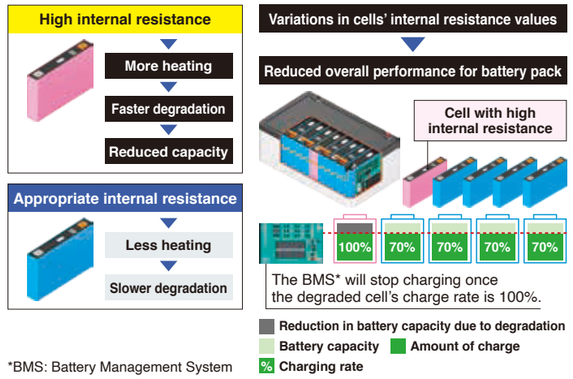
Acceptance/shipping inspections

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

Measuring battery performance and safety

Manufacturing batteries with stable performance

Explanation **Battery quality and internal resistance (AC-IR)**



*BMS: Battery Management System

Relationship between the internal resistance and the decline of battery cell capacity

Battery cells with high internal resistance tend to generate more heat and degrade faster. When cells degrade, their capacity declines, and their internal resistance rises. Internal resistance also changes over time or as a consequence of vibrations during shipment. It's essential to eliminate cells with high internal resistance by carrying out an inspection each time cells are shipped or received.

Internal resistance and battery pack performance

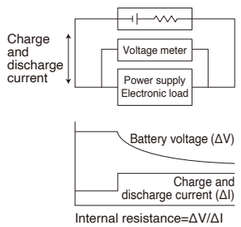
It's important that all the cells in a given battery pack have uniform internal resistance. If one or more cells have high internal resistance or have degraded, they will become a bottleneck and limit the battery pack's capacity. Moreover, the battery pack's performance will rapidly decline as the BMS* attempts to protect degraded cells with reduced capacity from overcharging and over-discharging. You can improve battery cell quality by selecting cells with uniform internal resistance so that they will degrade uniformity.

Internal resistance measurement (AC-IR measurement)

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

There are two methods for measuring a battery's internal resistance: the AC method and the DC method. Resistance values are known as AC-IR when measured using the AC method, and as DC-IR when measured using the DC method. AC-IR and DC-IR have a complementary relationship, and it's recommended to choose the one that best suits your application, or to carry out both measurements. HIOKI battery testers can perform 4-terminal AC-IR measurement.

DC method (DC-IR)



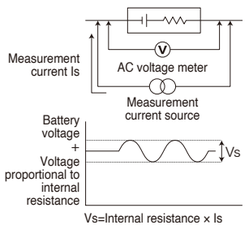
When you want to check battery performance under conditions close to actual operation

Issues with DC-IR

- Measurement takes more time.
- Measurements are less reproducible.
- Battery charges rate changes.
- Large charging and discharging equipment is required.
- The line must be capable of supplying large amounts of power.

Connect a load and measure the resistance value based on the change in voltage and current.

AC method (AC-IR)



When you wish to identify defective products quickly and accurately, for example during shipping or acceptance inspections

Issues resolved by AC-IR measurement

- Quickly measurement with milliseconds.
- Measurements are highly reproducible.
- Battery charges rate not changes.
- Testing can be carried out with compact equipment in an energy-saving manner.

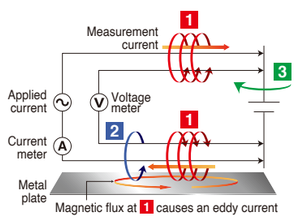
Apply the measurement current at a measurement frequency of 1 kHz and calculate the battery's internal resistance from an AC voltmeter's voltage value.

Two standards on LIB performance testing, **IEC 61960-3/JIS C8711** (for compact equipment) and **IEC 62620/JIS C8715-1** (for industrial equipment), describe how to measure internal resistance using the AC method (AC-IR). The method is also used in manufacturing processes for automotive LIB cells, which are required to deliver high levels of performance and safety.

Low-resistance measurement (1 mΩ and lower) for large batteries

BT4560

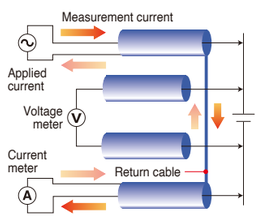
The larger the battery, the lower its internal resistance. Large batteries used in automobiles and infrastructure applications sometimes have internal resistance values of less than 1 mΩ. The BT4560's four-terminal-pair measurement method, which reduces the effects of induction fields, is an optimal solution for accurately measuring such low resistance levels.



The induction field can cause some measurement error.

Measurement using the four-terminal method, which is susceptible to the effects of induction fields

1 magnetic flux generated by measurement current
2 magnetic flux generated by eddy current
3 external magnetic flux



BT4560

Stable, high-precision measurement using the four-terminal-pair method

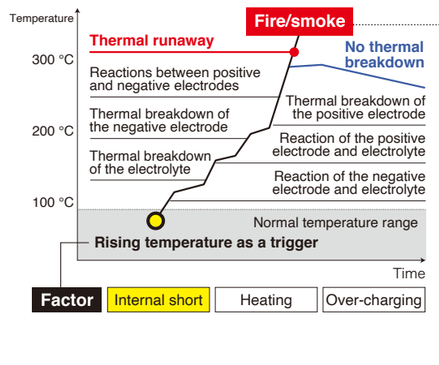
The effects of induction fields can be reduced by applying a current that flows in the opposite direction as the measurement current in order to limit magnetic flux.

Measuring battery performance and safety

Manufacturing highly safe batteries

Explanation **Internal shorts and open-circuit voltage (OCV)**

Mechanism that causes battery fires



Dendrite or contaminated metal
(Dendrite: Metals precipitated dendritic form)

Internal shorts

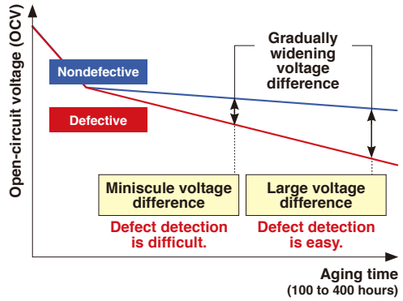
Insulation defects, which can be caused by factors such as ageing and vibrations during shipment, can lead to fire and other dangerous accidents, making it necessary to check open-circuit voltage values in order to distinguish between defective and non-defective products.

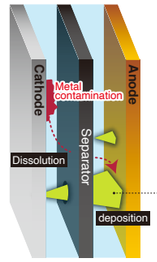
Open-circuit voltage (OCV)

The battery voltage when no load is connected is known as the open-circuit voltage (OCV). When an insulation defect such as an internal short occurs inside the battery, self-discharge causes the open-circuit voltage to decrease.

Open-circuit voltage (OCV)

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560, DM7276





Since the amount of change in OCV caused by self-discharge is extremely small, it is necessary to age batteries at least 100 to 400 hours before testing can accurately distinguish between non-defective and defective products. Additionally, it is necessary to measure OCV multiple times during the aging process. Using an instrument with good accuracy makes it possible to remove defects from the testing line earlier in the process, significantly reducing management and testing costs.

Dendrites form over time as minuscule metal fragment contaminants dissolve, leading to internal shorts.

High-accuracy OCV measurement

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560, DM7276

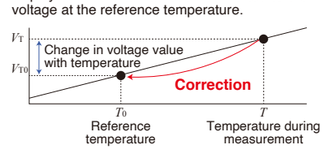
OCV fluctuates with the ambient temperature

A battery's OCV value can fluctuate several hundred microvolts with a change of just 1°C in the ambient temperature. Temperature correction functionality allows the instrument to display a value that has been converted to the voltage at the reference temperature.



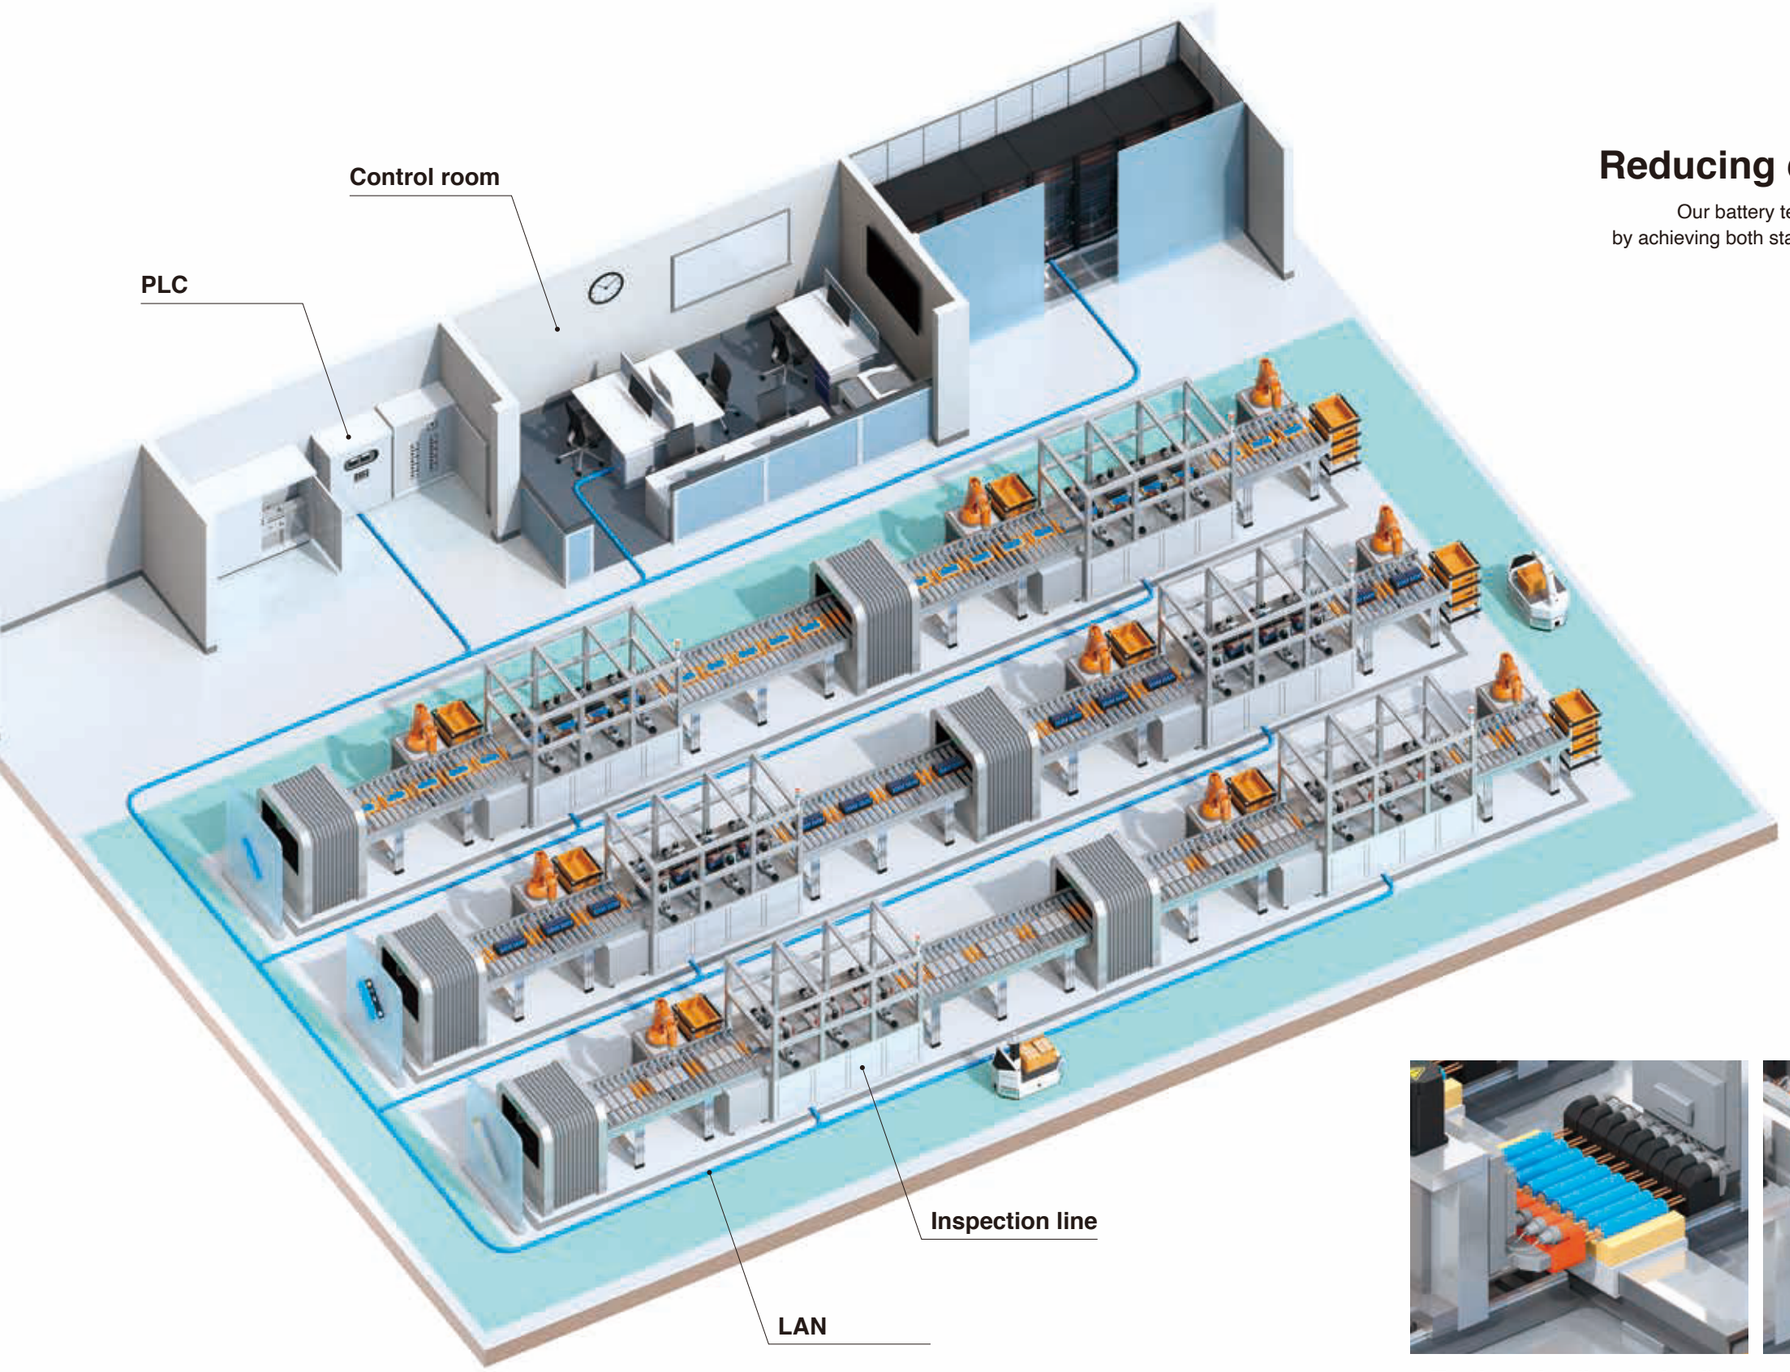
$$V_{T0} = \frac{V_T}{1+\alpha_{T0}(T-T_0)}$$

V_T : Measured voltage value [V]
T : Current ambient temperature [°C]
V_{T0} : Voltage value after correction [V]
T_0 : Reference temperature [°C]
α_{T0} : Temperature coefficient at T_0 [1/°C]

Acceptance/shipping inspections

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

Integrate to automatic testing system



Lowering production costs
Reducing downtime and shortening test times

Our battery testers resolve issues manufacturers face when they build production systems by achieving both stable, high-precision measurements and reduction of downtime and test times.

Our Battery testers meet these needs...

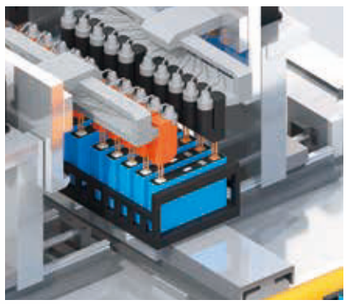
“We want to reduce system development cost and management man-hours.”

“We want to increase productivity by shortening test times.”

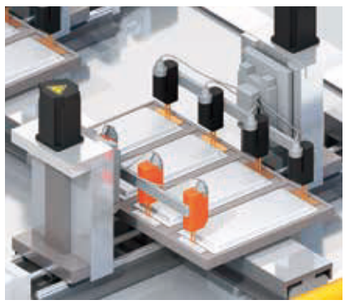
Examples

- Reducing downtime caused by measurement errors
- Reducing downtime caused by instrument malfunctions
- Lengthening the probe replacement cycle
- Controlling instruments with embedded relays
- Establishing long measurement cable runs
- Using thinner wires for measurement cables
- Connecting a PLC to a testing line via LAN
- Using multiple instruments simultaneously
- Increasing the number of test channels

Testing of cylindrical cells



Testing of prismatic cells



Testing of pouch cells

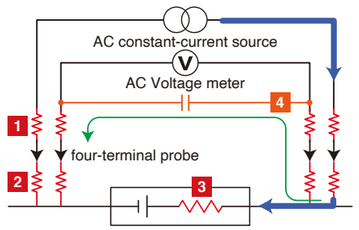
Acceptance/shipping inspections

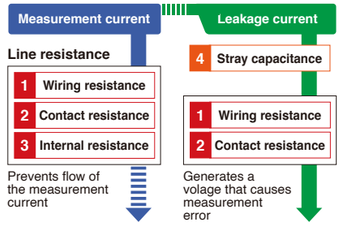
3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

Integrate to automatic testing system

Reducing test system development cost and management man-hours

Explanation Line resistance and measurement current, line resistance and leakage current





High line resistance can cause current errors and measurement errors, preventing accurate testing.

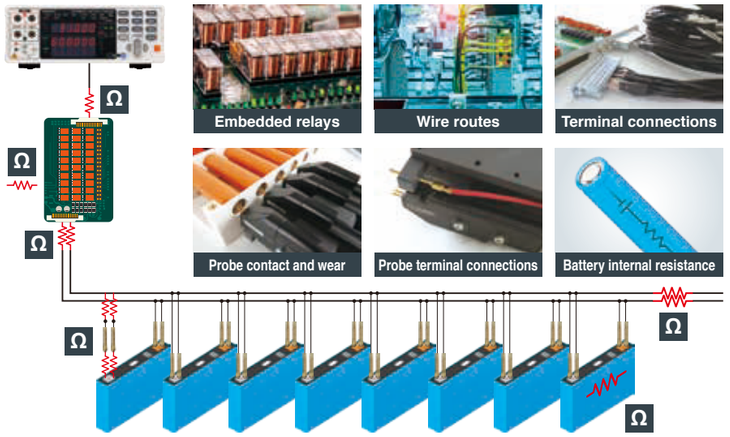
Constant-current errors

Flow of the measurement current is prevented, causing a constant-current error and making measurement impossible.

Measurement errors

Stray capacitance between cables causes a leakage current through the line resistance, generating a voltage that causes a measurement error.

Explanation Line resistance: causes and issues



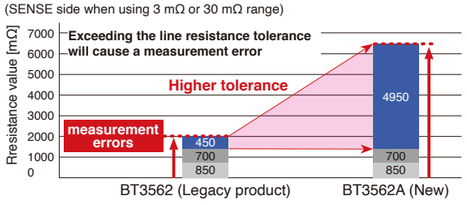
- Embedding relays
- Using long measurement cables
- Using thin measurement cables
- Using worn probes
- ▼
- Line resistance increases
- Current errors occur
- Measurement errors occur
- ▼ ▼
- More management man-hours
- Lower productivity

Increasing line resistance tolerances

BT3561A, BT3562A, BT3563A NEW

The new BT356xA has dramatically improved tolerances for line resistance compared to previous models. This improvement makes it easy to build test systems with large numbers of channels using relays. Additionally, a longer maintenance cycle for systems in use means fewer maintenance man-hours. Finally, its capability to handle thinner cables than with previous models*3 makes it easier to route cables.

(SENSE side when using 3 mΩ or 30 mΩ range)



- **Margin before threshold at which a measurement error occurs**
- Line resistance of relay circuit (SW1001 + SW9001)
- Line resistance of 4 m measurement cable (When using AWG 25 cable) (AWG 25: 0.162 mm²)

Issues resolved by improved tolerance

- More relay options
- Able to use longer measurement cables*3
- Able to use thin measurement cables*3
- Fewer probe replacements

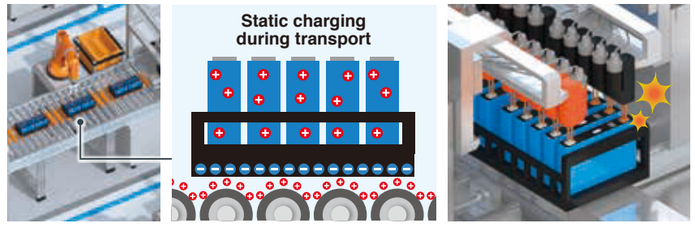
*1: Typical value *2: Total line resistance = (Wiring resistance + Contact resistance + DUT resistance)
*3: AWG 29 (0.064 mm²) wire equivalent to 2.2 Ω over an 8 m round trip can be used with the 3 mΩ or 30 mΩ range.

Preventing instrument malfunctions caused by static electricity

BT3561A, BT3562A, BT3563A NEW

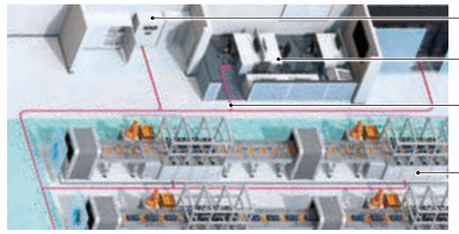


Batteries can become charged on production lines, for example, when being transported on a conveyor belt. When probes are placed in contact with such batteries, the resulting application of static electricity can then damage the instrument. The BT356xA series is designed to withstand contact with ±30 kV of static electricity*, preventing static-caused malfunctions and reducing testing line downtime.

* ±30 kV IEC 61000-4-2 contact discharge

LAN interface as standard

BT3561A, BT3562A, BT3563A NEW



The BT356xA series is equipped with a LAN interface as standard equipment, making it easy for the instrument to interoperate with a PLC*2-based control system. The ability to use readily accessible LAN cables helps lower costs during system development and maintenance. Furthermore, a design with strong noise and static electricity resistance helps avoid system problems.

*1: Max.30 m
*2: Programmable Logic Controller, a device that automatically controls one or more machines

Contact check

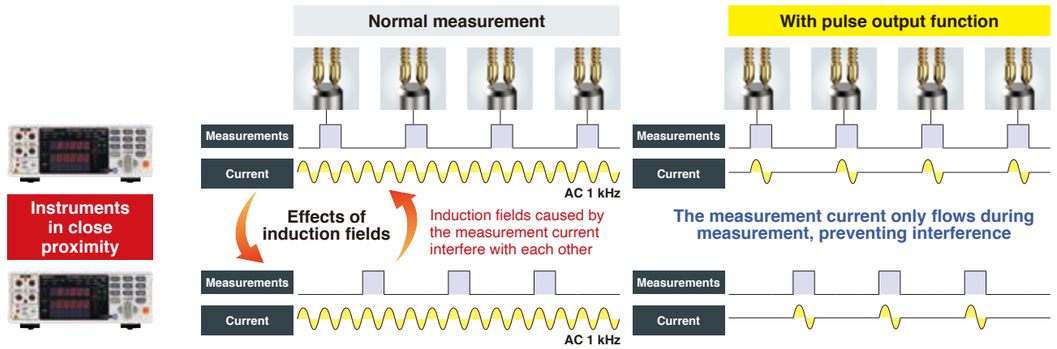
3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

Accurate probing is essential for accurate measurement. Our battery testers are equipped with probe contact monitoring functionality to ensure highly reliable testing.

Using multiple instruments simultaneously

BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

When multiple battery testers are used at the same time, their induction fields can interfere with each other, causing measurement errors. Since the instruments' measurement currents flow continuously, such interference can occur even if measurements are timed so that they don't occur simultaneously. The measurement current pulse output function allows the measurement current to flow only during measurement. By using this function to make alternating measurements, you can avoid the effects of interference between induction fields caused by the measurement current.



Acceptance/shipping inspections

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

Integrate to automatic testing system

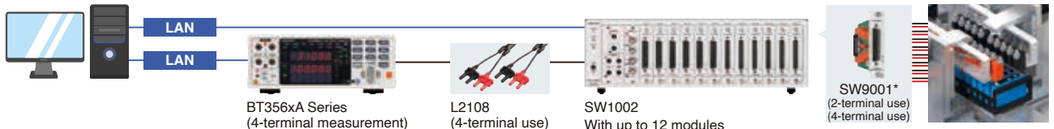
Improving productivity by reducing test times

Multiple measurement with scanner

3561, 3561-01, BT3561A, BT3562A, BT3563A, BT3564, BT3562-01, BT3563-01, BT4560

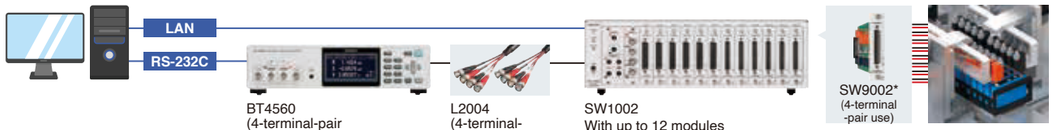
You can use the Switch Mainframe SW1001/SW1002 to increase the number of measurement channels. Additionally, you can perform scan measurement by controlling two instruments at once, for example a BT356xA series instrument and a DM7276, or a BT4560 and a DM7276.

BT356xA 132 ch — **AC-IR measurement (1 kHz) , OCV measurement**



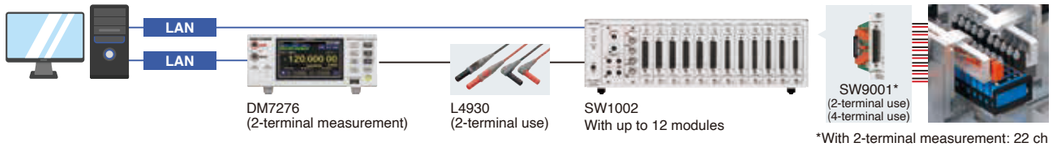
*With 4-terminal measurement: 11 ch

BT4560 72 ch — **AC-IR measurement (frequency sweep), OCV measurement**



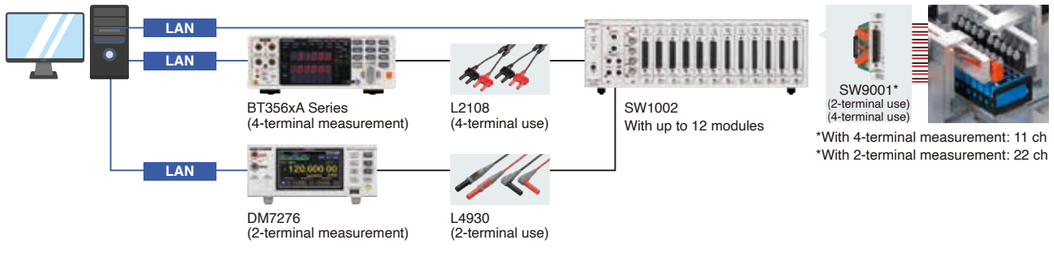
*With 4-terminal-pair measurement: 6 ch

DM7276 264 ch — **High-accuracy OCV measurement, Temperature Compensation Function**



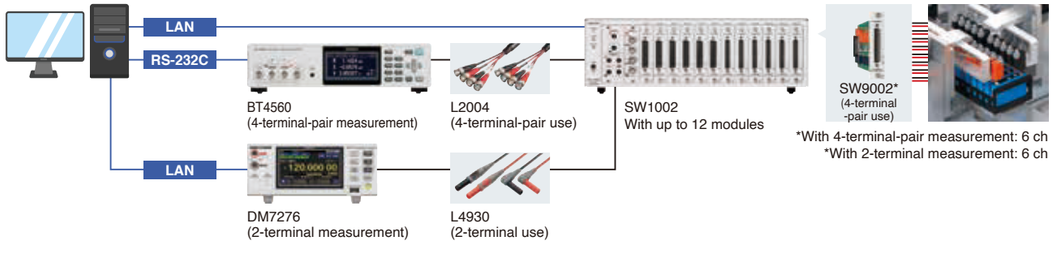
*With 2-terminal measurement: 22 ch

BT356xA + DM7276 132 cells — **AC-IR measurement (1 kHz) and High-accuracy OCV measurement, Temperature Compensation Function**



*With 4-terminal measurement: 11 ch
*With 2-terminal measurement: 22 ch

BT4560 + DM7276 72cells — **AC-IR measurement and High-accuracy OCV measurement, Temperature Compensation Function**



*With 4-terminal-pair measurement: 6 ch
*With 2-terminal measurement: 6 ch

*Power Line Cycle 20 ms at 50 Hz, 16.7 ms at 60 Hz

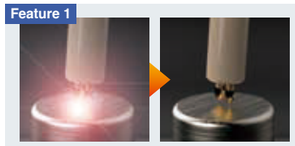
Internal resistance and open-circuit voltage for various battery types and compatible instruments

Testing high-voltage battery packs safely

BT3564 Max. input voltage 1000 V

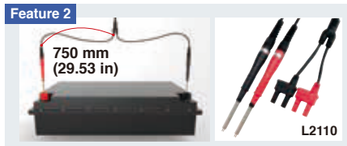
The BT3564 can safely test high-voltage battery packs such as infrastructure storage batteries.

Feature 1



The instrument reduces the likelihood of spark discharges, which are prone to occur during high-voltage measurement, by limiting the amount of current that flows the instant contact is established with a battery pack.

Feature 2



The optional L2110 probe, which is designed specifically for use with the BT3564, can make measurements safely thanks to its 1000 V withstand voltage. Additionally, the probe is designed to accommodate battery packs whose terminals are placed far apart.

Diagnosing degradation in batteries

BT3554-50, BT3554-51, BT3554-52

Ensure power quality in the event of an emergency at facilities such as manufacturing plants, buildings, and datacenters.

Lead-acid or Lithium ion batteries

*BT3554-5x able to measure Lithium ion batteries.

Accurately diagnosing battery degradation in an operating UPS

Measuring the battery's internal resistance and voltage to determine whether it has degraded

Our Battery testers meet these needs...

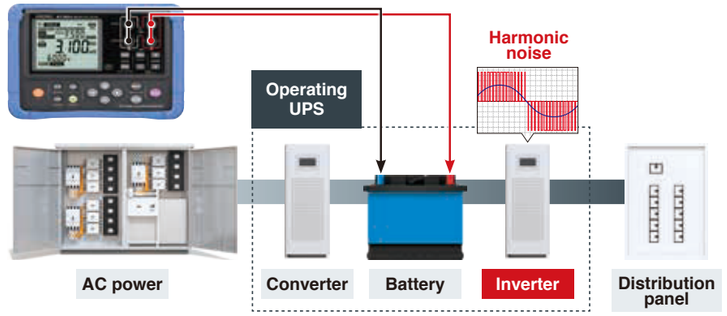
"We want to detect battery degradation in an operating UPS."

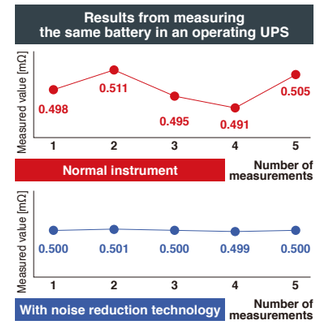
"We want to complete an intensive inspection workload efficiently."

Accurate measurement, even in a noisy environment

BT3554-50, BT3554-51, BT3554-52

Inverters in operating UPS systems generate harmonic noise, and instruments usually have difficulties to make accurate measurements when affected by such noise. The BT3554-5x is able to measure accurately even when exposed to inverter noise thanks to its noise reduction technology.





Completing an intensive inspection workload efficiently

BT3554-50, BT3554-51, BT3554-52

You can efficiently inspect an enormous number of batteries, for example those found in UPS systems, with our free app "GENNECT Cross"

Register site information in advance

Registration of profile information
- Location information: Office Building East Wing
- Device information: UPS for server
- Battery number: 1 to 500

[Next: battery No.1] Audio guidance indicates the next battery number to be measured.

Send measurement data

[No.1: PASS] Audio guidance indicates measurement results.

[Next: battery No.2] ••• [No.2: PASS]

[Next: battery No.3] ••• [No.3: PASS]

[Next: battery No.4] ••• [No.4: FAIL]

Measurement data is recorded along with previously registered profile information.

Profile information	
Profile number	1
Location information	Office Building East Wing
Device information	UPS for server
Battery number	1
Measurement data	
Memory number	A.001
Data and time	2021/4/20 13:00:00
Resistance value	x.xxx mΩ
Voltage value	xx.xx V
Temperature	xx.xx°C
Comparetor Threshold value	x mΩ / x mΩ / x V
Judgement result	PASS/WARNING/FAIL

Up to 100 sets of profile information can be registered on the BT3554-5x. Up to 500 data sets can be saved for each profile. (The BT3554-5x can save up to 6,000 data sets.)

To use GENNECT Cross, you must install the Wireless Adapter Z3210 (sold separately) and the GENNECT Cross app on your device.
Profile information can be registered on the BT3554-50 from either GENNECT Cross or the desktop application GENNECT ONE.

Analyzing batteries

BT4560

Assessing battery characteristics with Nyquist or Cole-Cole plot

You can assess battery characteristics by analyzing Nyquist or Cole-Cole plots based on impedance values generated by frequency sweep measurement.

Our Battery testers meet these needs...

"We want to measure impedance using the frequency sweep method."

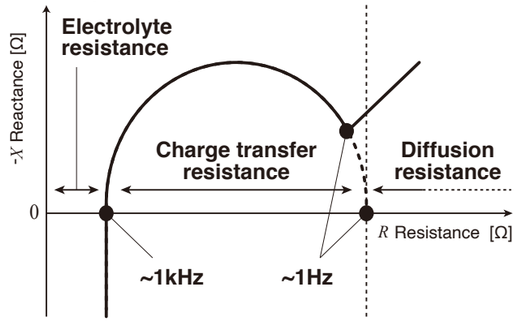
"We want to assess battery characteristics with Nyquist or Cole-Cole plots."

Assessing battery characteristics

BT4560

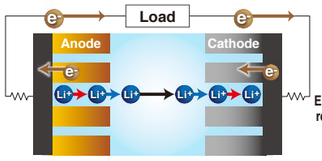
The chemical reactions in batteries involve several processes and each process has its own reaction speed. Therefore by sweeping the frequency and measuring the impedance the characteristics of each part can be evaluated separately.

Drawing a Nyquist or Cole-Cole plot with an impedance spectrum

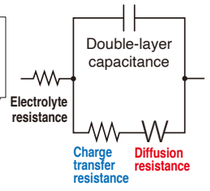


less than 1 Hz	Low frequencies	Li-ion diffusion in the electrode (Diffusion resistance)
1 Hz to several hundred Hz	Intermediate frequencies	Li-ion transfer (Charge transfer resistance)
About 1 kHz	High frequencies	Li-ion transport in electrolyte (electrolyte resistance)

Diagram of a discharging battery



Simple equivalent circuit

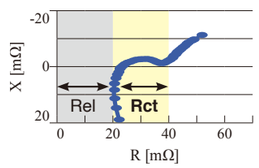


Check the battery deterioration level

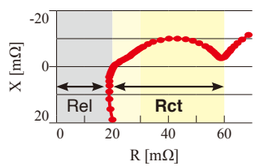
The resistance of a degraded battery is significantly larger than a pristine one. The degradation of charge transfer resistance is particularly noticeable in the Nyquist or Cole-Cole plot for applications that involve charging/discharging at low temperatures or deep charging/discharging (SOC between 0% and 100%).

Compare measured data for pristine and deteriorated batteries

Pristine battery



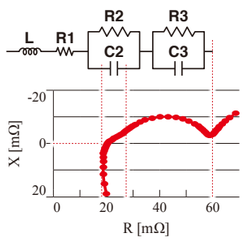
Degraded battery



Rel: Electrolyte resistance **Rct: Reaction resistance**

Idenfity battery deterioration factors

An equivalent circuit analysis software (e.g. ZView®*) can provide the parameters of each element of an equivalent circuit model by means of curve fitting. It allows you to see which part of the battery has shown characteristic changes. This serves to identify battery deterioration factors.



An example of an equivalent circuit

R1	Resistance in the electrolyte and tab welding
R2//C2	Reaction at anode
R3//C3	Reaction at cathode
L	Lead and other inductance

*ZView® is a product of Scribner Associates, Inc.

Measurement frequencies and low-impedance measurement

BT4560, IM3590

The BT4560 offers measurements in the optimal frequency range for liquid Li-ion batteries. Its unparalleled capability to measure extremely low impedance is ideal for large cells such as ones for xEVs or ESSs. As a complementary instrument, the IM3590 offers impedance measurements across a wider frequency range. It is very capable at measuring larger impedance.

Model	Measurement frequency	Impedance measurement ranges	Max. Voltage
IM3590	1 mHz to 200 kHz	100 mΩ to 100 MΩ	5 V
BT4560 (Special specifications for 10 kHz)	0.01 Hz to 10 kHz	3 mΩ, 10 mΩ, 100 mΩ	5 V
BT4560 (Standard specification)	0.1 Hz to 1050 Hz	3 mΩ, 10 mΩ, 100 mΩ	5 V
BT4560 (Special specifications 1)	0.1 Hz to 1050 Hz	30 mΩ, 300 mΩ	10 V
BT4560 (Special specifications 2)	0.1 Hz to 1050 Hz	30 mΩ, 300 mΩ, 3 Ω	20 V
BT4560 (Special specifications 3)	0.01 Hz to 1050 Hz	3 mΩ, 10 mΩ, 100 mΩ	5 V
BT4560 (Special specifications 4)	0.01 Hz to 1050 Hz	30 mΩ, 300 mΩ	10 V
BT4560 (Special specifications 5)	0.01 Hz to 1050 Hz	30 mΩ, 300 mΩ, 3 Ω	20 V

	CT6846-05	1000 A	DC to 20 kHz	φ50 mm

Multi-plot

Web application "Multi-plot"

Converting measurement data into a Nyquist or Cole-Cole plot

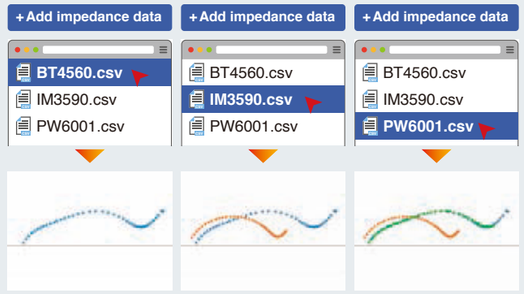
web browser link
https://www.circuitfitting.net/multiplot

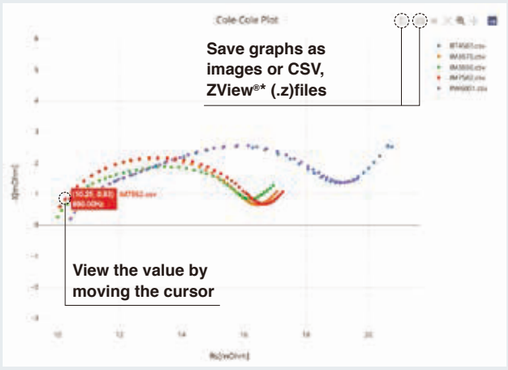
"Multi-plot", a free web application, enables you to draw a Nyquist or Cole-Cole plot simply by loading a file in your web browser.
Supported files: **CSV file, ZView®* (.z) file**
Supported instruments: **BT4560, PW6001, IM3536 , IM3570, IM3590, IM758x**

Draw Nyquist or Cole-Cole plots freely, **without any limits** on the number of points that can be rendered from files or the number of graphs that can be superposed. The horizontal and vertical axes are automatically scaled based on the graphs being rendered. You can even superpose, compare, and analyze files acquired using different instruments.

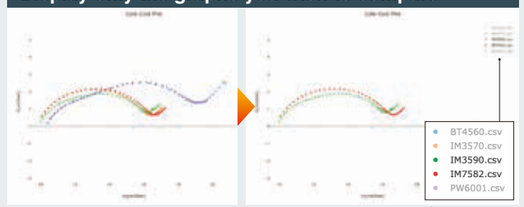
Loading files and superposing Nyquist or Cole-Cole plots

(You can even superpose files acquired using different instruments.)

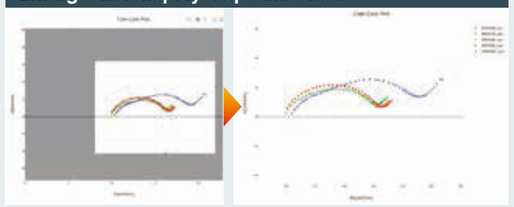




Display only the graphs you wish to compare

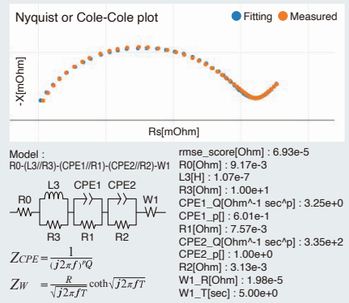


Enlarge and display a specific area



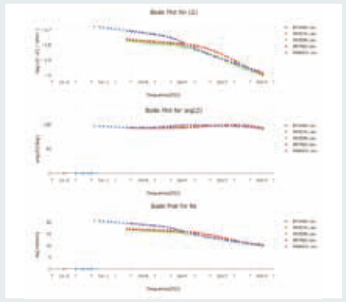
Analysis function

Conduct an equivalent circuit analysis



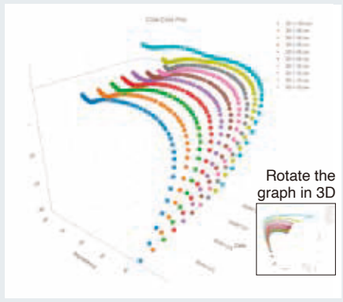
Analyze the data with predefined models. Display analysis results automatically simply by loading a file.

Draw Bode plots to assess phase characteristics



Bode plots are also drawn, enabling to assess phase characteristics.

Analyze characteristics with 3D view



Draw 3D Nyquist or Cole-Cole plots or 3D Bode plots, using the time or date as a third axis. Rotate 3D graphs in any direction as desired and save images.

Measurement lead and measurement probe compatibility chart

YES	:	Recommended measurement lead or measurement probe listed in brochures.
N/A	:	Not compatible due to inability to connect.
*1	:	Not subject to accuracy guarantee.
*2	:	May be susceptible to external noise. Caution is particularly required when using a measurement current of 10 mA or less.
*3	:	BNC – banana plug adapter (See page 19) Connect the black banana plugs to the HCUR and HPOT terminals to reduce the influence from external noise.
*4	:	Temperature sensor cannot be connected.
*5	:	It does not use a 4-terminal-pair design, so wiring placement will have a greater effect on measured values.
*6	:	Some measurement ranges cannot be used due to rated current limitations.

Appearance		Dimensions (mm) *1	Model withstand voltage	3561 3561-01	BT3561A BT3562A BT3563A	BT3562-01 BT3563-01 BT3564	BT4560	BT3554-50

*1: Dimensions other than overall length include typical values.

*2: HIOKI recommends measurement leads without separate guard terminals: L2101 - L2107, L2102 - 9770, L2103 - 9771, L2104 - 9453

Batteries are a driving force for a variety of innovations as we move towards a sustainable society

Batteries are used in an array of applications, and their performance can be a driving force for a variety of innovations and new lifestyles. The development and production of high-quality batteries will play an essential role as we work to realize a sustainable society. At the same time therefore, growing improvements in battery life cycle assessment have become a major priority. the focus on reducing CO2 emissions throughout the entire life cycle by means of improvements in manufacturing processes and reuse of high-quality batteries is increasing. HIOKI battery testers are helping resolve these issues through an electrical measurement approach.

Stacked battery voltage, Internal resistance of battery cells

FCV
800 V to 1000 V, 0.2 mΩ

EV truck
800 V to 1000 V, 0.2 mΩ

EV bus
800 V to 1000 V, 0.2 mΩ

EV car
200 V to 400 V, 0.3 mΩ to 1 mΩ

Storage batteries for home use
200 V to 400 V, 0.3 mΩ to 1 mΩ

Automatic transfer system
72 V to 96 V, 1 mΩ

Forklift
72 V to 96 V, 1 mΩ

5G base station
48 V, < 1 mΩ

Electric motorcycle
48 V to 96 V, 10 mΩ

Electric tricycle
48 V to 96 V, < 10 mΩ

Large drones
24 V to 48 V, 10 mΩ

Automatic transfer robot
24 V to 48 V, 10 mΩ

Electric bike
24 V, 10 mΩ

Power tool
12 V to 24 V, 10 mΩ

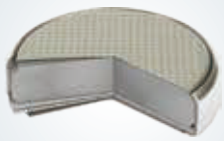
Cleaner
12 V to 24 V, < 10 mΩ

Laptop
7 V to 12 V, 100 mΩ

Tablet
3.7 V, 10 mΩ

Smart phone
3.7 V, 100 mΩ

Smart watch
3.7 V, 300 mΩ



Coin cell, All solid-state cell
3.7 V, < 100 Ω
